

Bad Breath Therapy

Whether you find yourself face-to-face with a victim or simply have personal concerns and have to mask it with mints and candies, it's a familiar enemy. We've gained special expertise in halitosis treatment. We'll diagnose the problem and find you an effective solution to stop the problem and so you can get close to people again. You may try a simple solution that often helps without our clinical involvement. Face your friends with confidence. Get a little closer.

How to know if you have bad breath

Most of the time people get so accustomed to their own odors that they cannot smell their bad breath. Usually, you can realize that there is something wrong if people you talk to turning their head away, rubbing their noses or by other indirect signals. Persons close to you may tell you openly about your problem. We can analyze your breath using a Halimeter. The device detects the level of a gas produced by bacteria.

How to get rid of bad breath

Bacteria in your mouth hide deep inside the gums advancing through the root's surfaces down to the bone that supports teeth and creating focal points of chronic infection. Proper diagnosis early is essential. Undiagnosed, the problem can get worse year after year. To get rid of bad breath you need to get rid of the bacteria that causes it. Our special program helps accomplish this goal by combining initial therapy with a new concept of home care and nutritional support. It has brought relief to many and it can help you too.

Is the treatment results permanent?

The proliferation of certain bacteria changes the "ecosystem" in your mouth. The balance is shifted toward the aggressive type of bacteria that give you bad breath. Our patients feel relief after the treatment and most of them notice the change even before the treatment is completed. However, it takes consistent effort to reverse this unbalanced ecosystem. It requires your commitment to effective home care and regular maintenance. By sticking to the individually designed home hygiene protocol, you'll get consistently better as the non-aggressive types of bacteria restore the ecosystem. Staying healthy is also significant because, like with any disease, having a good immune system is important.

Why mouth rinse and tooth paste advertised on TV do not work

Over the counter products do not address the bacterial problem, they focus instead on masking the odor and giving a false impression of "a magic pill". However, there are products (toothpaste, mouth rinse, etc.) which contain chlorine dioxide - a well-known antiseptic - that work in some cases. Also, if you have a heavy bacterial build up on the back of the tongue you might benefit from scraping it off. Special irrigation also was proven to be a great tool. We've put together a couple of simple and inexpensive antibacterial [fresh breath kits](#) for home care that might be good for you. It can be purchased on line or by calling our office. Or you may prefer to contact us for a [free initial consultation](#) and consider getting on our treatment program. Start making changes today.

Why brushing and flossing doesn't do anything

For a lot of people it seems inconceivable that they would have bad breath originated in their mouth - after all you brush your teeth. But bacteria, which accumulate around the teeth, start their harmful work between them especially in the back where it is hard to reach and where very few people floss. The underlying problem of bad breath is the bacterial infection. The bacterial toxin works on pulling off the gums from the teeth allowing the bacteria to advance very deep. No floss, or brush, or mouthwash can get deep inside. Actually, these affected sites are just like the chronic wounds and if they are not properly cared for the process never stops and only gets worse. Our goal is to halt the progression of this disease and to eliminate your bad breath. The effective program that we've designed integrates for you all the necessary components of treatment and the follow up care.

How gum surgery helps

Usually the gum surgery is performed in order to open the infected areas inside the gums and to access the hidden parts of teeth and bone. It is like lifting the curtains if you want to clean your windows thoroughly. The problem is that people skip after surgery the most important part - regular maintenance. If you've cleaned up your neglected weedy garden you'll see the weeds will grow wildly again soon unless you keep coming back repeatedly and control it. What makes the difference in our program and why it works is because we strictly conform to the follow up care. And we rarely have to resort to the gum surgery. Not only we teach our patient about everyday oral hygiene but we also support the instructions with special appliances and antibacterial products for better tooth cleaning and irrigation. Your new and effective daily routine is easy to follow and it lives your mouth and your teeth pleasantly clean and fresh. The best part is that you do not have to recourse to mints and gum.

Testimonials

"...I feel much better now and can actually talk face to face to my coworkers and customers. No more bad breath and nobody offer me mints or gum any more. My social life improved too..." —Ms S., 36

"...I remember when I came to see you for the first time I was not able to look straight into your face being so ashamed of my bad breath. No more... I've met a new friend. She is great and we are going strong. And there is no need to chew gum any more. I really hated it..." —Mr. Q., 42
