

# Implants and Related Restorations

The cutting edge technology to replace your lost teeth. Once installed into the bone for support, like you own roots before, different implants provide a variety of use for missing teeth: from a removable denture alternative that can revitalize your mouth with amazing results and security you need and too many other related functions when it comes to missing teeth. You would never need to remove them from your mouth. Brush them like you natural teeth.

**Q&A:** I have a lot of missing teeth and have been postponed their replacement due to the personal economic problems. I've heard that implants are great. Are they good for me?

Implants have been around for years and they have been widely used in dentistry and in surgery (artificial joint like hip and/or knee) but only now after decades of clinical and scientific research they became a reliable and a main stream procedure in dentistry. Like in case with the roots of your own teeth implants provide the support for substructure which could be used for fixed bridges, crowns and removable dentures. The results are fantastic. The miracle of dental implants is hard to underestimate. But they do not come inexpensive and it takes an oral surgery for their insertion and requires several months of healing. In the end they'd give you and the unbelievable sense of security, strengths and longevity.
